I tried to find an answer but couldn't find anything that met my needs. Could anybody help me with this problem please? Thanks in advance. A: If you are using SQL Server, you can use the DATE datatype or SYSDATETIMEOFFSET() function (depending on how you want to display your time) to determine the date and time that a record was created. In a stored procedure, you can create a variable of DATE or SYSDATETIMEOFFSET() and then use that variable in a UPDATE statement. For example: SELECT * FROM TableName WHERE something = @variable UPDATE TableName SET TableName.columnToUpdate = @variable You can alternatively use a trigger to achieve the same result. Q: QDomDocument::parseFragment error in Qt I have the following problem with Qt: In my program, I have a subclass of QDomElement (called element_1) that has a QDomDocument as a member, and this document is edited from element_1::editDocument(QDomElement* before) and element_1::editDocument(QDomDocument* before). Then in element_1::updateDocument(QDomDocument*) I call: element_1::updateDocument(doc) where doc is: QDomDocument doc; doc.setContent(doc.index("..."), from); I also have the following method: QString toPlainText(const QDomElement &e) { QDomDocument *doc = e.toDocument(); QDomDocumentFragment *frag = doc->createDocumentFragment(); QDomElement newElement = doc->createElement("string"); newElement.setTextContent(e.toText()); frag->appendChild

We present a mesoscopic agent-based simulation model of dense colloids subjected to laser-induced shear. In contrast to previous experiments, where the initial collapse of the system takes place solely via the translation of the center of mass of the colloid, here we exploit the combination of laser-induced heating and external pressure to drive the system into a phase-separated state. Using the Kertész Line concept, we identify in our systems a nonequilibrium transition between the transient soft state and the arrested state. In contrast to previous theoretical descriptions of phase transitions, our theory is based on the assumption that the stress-induced order parameter is identical to the current single parameter describing the degree of arrest. The dynamical phase transition corresponds to a nonequilibrium avalanche process, in which the degree of arrest is built up from tiny fluctuations in the total strain energy of the system. On the mesoscopic scale, the system-size dependence of the correlation time follows a power law with an exponent that differs significantly from the value commonly found for standard phase
