
Single Skin Paraglider Software 30

December 11, 2011 - I'm writing my own software for making flat panels for a single skin paraglider (with some differences in the design of the triangles) and would be glad to see. It's not exactly a Java project. I'm using a language that I usually use for other projects that I usually work with. I'm working on a Python project, but I'm not sure what would be the best environment. I am new to Python so I will be learning along the way. I prefer Python because it's very flexible and not particularly complex. I know that I don't have to do many other parts besides creating and building the program. I'm looking for advice. I don't want this to be too complex and complicated.
